6/02

The present invention relates to a permanent rod. The permanent rod includes a tube-shaped rod body. In the rod body, a pair of cut surfaces is provided to form a band-shaped insertion opening over the entire longitudinal section of the rod body, and a plurality of compression grooves each having a concave bottom surface are formed in the outer surface of the rod body over the entire longitudinal section. Also, the permanent rod includes: a compression member body having a compression surface corresponding to each of the grooved bottom surfaces; and a compression member detachably coupled to the rod body so that the compression surface contacts the grooved bottom surface. Therefore, the permanent rod may create various wave styles.

PERMANENT ROD

CROSS-REFERENCE TO RELATED
APPLICATION

This application claims the benefit of Korean Patent Application No. 10-2012-0003799, filed on Jan. 12, 2012 in the Korean Intellectual Property Office, the disclosure of which is incorporated herein by reference.

TECHNICAL FIELD

The present invention relates to a permanent rod, and more particularly, to a permanent rod which is used in making permanent waves in the hair.

BACKGROUND ART

In general, a hair style is an important factor in the cosmetic treatment of a woman, and is set variously depending on dresses, times and places.

As a method of setting the hair style, a method of making waves in the hair is widely used. For this purpose, permanent rods were devised and are used.

FIG. 9 is an exploded perspective view of a permanent rod of the related art.

As shown in FIG. 9, the permanent rod of the related art includes a tubular rod body part **111** having a circular cross-section and an auxiliary rod member **120** which engages with the rod body part **111**.

The rod body part **111** has a member fitting recess **111b** having an arc-shaped cross-section that is greater than 180°. The member fitting recess **111b** extends along the length of the rod body part **111**.

The auxiliary rod member **120** has the shape of a hollow cylinder.

The rod body part **111** and the auxiliary rod member **120** respectively have injection-holes **111a** and **120a**.

With reference to FIG. 10, a description will be given below of a method of making waves in the hair using the permanent rod of the related art having this configuration.

First, the distal portion of the hair is wound around the auxiliary rod member **120**.

Afterwards, the auxiliary rod member **120** with the hair wound thereon is forcibly fitted into the member fitting recess **111b**.

After that, a length of the remaining portion of the hair that is desired to be waved is wound on the rod body part **111**.

Afterwards, a neutralizer is injected through the injection-holes **111a** and **120a** when about 30 to 40 minutes have elapsed after the hair was wound on the rod body part **111**.

After that, when about 10 to 20 minutes have elapsed after the neutralizer was injected, the hair is unwound from the rod body part **111** and the auxiliary rod member **120**.

Finally, the hair unwound from the rod body part **111** and the auxiliary rod member **120** is washed.

The related-art permanent rod having the above-mentioned configuration was disclosed in Korean Utility Model Application No. 20-1993-0001104 (titled "ROLL TO BE USED STRAIGHT PERMANENT WAVE").

However, according to the permanent rod of the related art, the rod body part **111** does not have any structure that can make any other waves except for the method of winding the hair thereon. It was impossible to make various waves, which is problematic.

DISCLOSURE

Technical Problem

Therefore, an aspect of the present invention is to provide a permanent rod with which various waves can be made.

Technical Solution

The object is realized by a permanent rod that includes a tubular rod body part and pressing members. The rod body part has a pair of cut surfaces which extend along an entire length of the rod body part so as to form a band-shaped insertion opening and a plurality of pressing recesses which extends along the entire length of the rod body part. Each of the pressing recesses has a concave recess bottom surface. Each of the pressing members has pressing member body part which has a pressing surface corresponding to the recess bottom surface. The pressing members are detachably coupled to the rod body part such that the pressing surface adjoins to the recess bottom surface.

It is preferred that the pair of cut surfaces have a concave-convex shape that allows the cut surfaces to engage with each other when the cut surfaces are adjoined to each other such that the rod body part is not warped when the hair is being wound on the rod body part.

In addition, it is preferred that each of the pressing recesses be formed so as to have a V-shaped recess bottom surface such that the movement of the hair that is brought into close contact with the pressing recesses by the pressing members can be reduced.

Furthermore, it is preferred that the rod body part have a ring-seating groove on an outer surface, the ring-seating groove extending in a longitudinal direction of the rod body part, such that the permanent rod according to the present invention can be used without the step of inserting the auxiliary rod into the rod body part.

In addition, it is preferred that each of the pressing members be tube-shaped and have injection-holes in an area that adjoins to the recess bottom surface such that waves formed by the pressing members can be reliably maintained.

Advantageous Effects

According to the present invention, it is possible to make various waves by forming waves using the pressing recesses formed on the rod body part and the pressing members which are coupled to the rod body part so as to be in close contact with the pressing recesses.

DESCRIPTION OF DRAWINGS

FIG. 1 is an assembled perspective view showing a permanent rod according to an embodiment of the present invention;

FIG. 2 is an exploded perspective view showing the permanent rod according to one embodiment of the present invention;

FIG. 3 is a detailed view showing the rod body part of the permanent rod according to one embodiment of the present invention;

FIG. 4 is a detailed view showing the pressing member of the permanent rod according to one embodiment of the present invention;

FIG. 5, FIG. 6 and FIG. 7 are views showing a method of using the permanent rod according to one embodiment of the present invention;

FIG. 8 is an exploded perspective view showing the permanent rod according to another embodiment of the present invention;

FIG. 9 is an exploded perspective view of a permanent rod of the related art; and

FIG. 10 is a view showing a method of using the permanent rod of the related art.

Description of the Reference Numerals in the Drawings

21: pressing member body part	22: fixing lever
120: auxiliary rod member	201: auxiliary rod

Best Mode

The present invention will be described in detail hereinafter with reference to the accompanying drawings.

FIG. 1 is an assembled perspective view showing a permanent rod according to one embodiment of the present invention, FIG. 2 is an exploded perspective view showing the permanent rod according to one embodiment of the present invention, FIG. 3 is a detailed view showing the rod body part of the permanent rod according to one embodiment of the present invention, and FIG. 4 is a detailed view showing the pressing member of the permanent rod according to one embodiment of the present invention.

As shown in these drawings, the permanent rod according to one embodiment of the present invention includes a tubular rod body 11 having a square cross-section and four pressing members 20 which are coupled with the rod body part 11.

The rod body part 11 has a pair of cut surfaces 11b which extend along the entire length of the rod body part 11 so as to form a band-shaped insertion opening 11a.

The pair of cut surfaces 11b has a concave-convex shape such that the cut surfaces 11b can engage with each other when they are adjoined to each other. The concave-convex shape of the cut surfaces 11b may include a variety of shapes, such as a saw-tooth shape and a wave shape.

In addition, the rod body part 11 has four pressing recesses 11c and a plurality of ring-seating grooves 11e on the outer surface and fixing protrusions 11f on the inner surface.

The pressing recesses 11c are formed on the side surfaces of the rod body part 11 such that one pressing recess is formed on one side surface. Each of the pressing recesses 11c extends along the length of the rod body part 11 so as to form a V-shaped recess bottom surface 11d.

Each of the ring-seating grooves 11e has a concave shape that extends in the longitudinal direction.

The fixing protrusions 11f are formed in the pressing recesses 11c such that a pair of the fixing protrusions 11f is formed adjacent to either end of each of the pressing recesses 11c.

Each of the pressing members 20 has a tubular pressing member body part 21 having a triangular cross-section and fixing levers 22 each of which is coupled to either end of the pressing member body part 21.

Two surfaces from among three side surfaces of the pressing member body part 21 form pressing surfaces 21a each of which has a V-shaped cross-section corresponding to the recess bottom surface 11d.

The pressing member body part 21 has support protrusions 21b each of which is provided on either end of each of the pressing surfaces 21a. The pressing member body part 21 has injection-holes 21d in the area that adjoins to the recess bottom surface 11d.

Each of the support protrusions 21b has a shaft-hole 21c.

Each of the fixing levers 22 has a pivot shaft 22a at one end and a fixing-hole 22b in an area that is adjacent to the other end.

Each of the fixing levers 22 is disposed such that the pivot shaft 22a is fitted into the shaft-hole 21c.

Each of the pressing members 20 having this configuration is coupled to the rod body part 11 in such a fashion that the fixing protrusion 11f is interference-fitted into the fixing-hole 22b in the state in which the pressing surfaces 21a are adjoined to the recess bottom surface 11d. The pressing members 20 coupled to the rod body part 11 can be separated from the rod body part 11 through removal of the fixing protrusions 11f from the fixing holes 22b.

With reference to FIG. 5 to FIG. 7, a description will be given below of a method of using the permanent rod having the above-described configuration according to one embodiment of the present invention.

First, the distal portion of the hair is wound around an auxiliary rod 201 the diameter of which is smaller than the diameter of the rod body part 11, and the hair is held to the auxiliary rod 201 using a rubber ring 202 (see FIG. 5).

Afterwards, the auxiliary rod 201 on which the hair is wound is inserted into the rod body part 11 through the insertion opening 11a.

After that, the remaining portion of the hair is wound on the rod body part 11 (see FIG. 6).

The pressing members 20 are sequentially coupled to the rod body part 11 so as to come into close contact with the recess bottom surfaces 11d whenever the hair passes over the pressing recesses 11c while the hair is being wound on the rod body part 11 (see FIG. 7).

When it is intended to wind the hair on the rod body part 11 at least once, the pressing members 20 coupled to the rod body part 11 are sequentially separated from the rod body part 11, and then are coupled again to the rod body part 11.

Afterwards, the rubber ring 202 is coupled to the rod body part 11 so as to be accommodated in the ring-seating grooves 11e.

After that, when about 30 to 40 minutes have elapsed after the hair was wound on the rod body part 11, neutralizer is injected through injection-holes 21d.

Afterwards, when about 10 to 20 minutes have elapsed after the neutralizer was injected, the pressing member 20 is separated from the rod body part 11.

After that, the rubber ring 202 is separated from the rod body part 11.

Afterwards, all of the pressing members 20 are separated from the rod body part 11.

In sequence, the hair is unwound from the rod body part 11.

Afterwards, the auxiliary rod 201 is separated from the rod body part 11.

After that, the rubber ring 202 is separated from the auxiliary rod 201.

Finally, the hair is washed.

Although the auxiliary rod 201 is inserted into the rod body part 11 in the above-described method of using the permanent rod, it is possible to use the permanent rod according to one embodiment of the present invention by omitting the step of inserting the auxiliary rod 201 into the rod body part 11.

Mode For Invention

Although the foregoing embodiment has the four pressing recesses 11c in the rod body part 11, it is possible to put the present invention into practice by forming 1, 2, 3, 4 or more pressing recesses (see FIG. 8).

In addition, although the rod body part 11 is configured so as to have a square or circular cross-section in the foregoing embodiment, it is possible to put the present invention into

5

practice by forming the rod body part **11** into a different shape such as a pentagonal cross-sectional shape.

Industrial Applicability

According to the embodiments of the present invention as set forth above, it is possible to make various waves by forming waves using the pressing recesses **11c** formed on the rod body part **11** and the pressing members **20** which are coupled to the rod body part **11** so as to be in close contact with the pressing recesses **11c**.

In addition, since the pair of cut surfaces **11b** has the concave-convex shape such that the cut surfaces lib can engage with each other when they are adjoined to each other, it is possible to prevent the rod body part **11** from being warped when the hair is being wound on the rod body part **11**.

Furthermore, since the pressing recesses **11c** are formed so as to have the V-shaped recess bottom surfaces **11d**, it is possible to reduce the movement of the hair that is brought into close contact with the pressing recesses **11c** by the pressing members **20**.

In addition, since the ring-seating grooves **11e** are formed on the outer surface of the rod body part **11** in the longitudinal direction, it is possible to use the permanent rod according to the present invention by omitting the step of inserting the auxiliary rod **201** into the rod body part **11**.

Furthermore, since the injection-holes **21d** are formed in the areas that adjoin to the recess bottom surfaces **11d** of the pressing members **20**, it is possible to reliably maintain waves formed by the pressing members **20**.

The invention claimed is:

1. A permanent rod comprising:

a tubular rod body part, wherein the rod body part comprises a pair of cut surfaces which extend along an entire length of the rod body part so as to form a band-shaped insertion opening and a plurality of pressing recesses which extends along the entire length of the rod body part, each of the pressing recesses having a concave recess bottom surface; and

pressing members, wherein each of the pressing members comprises a pressing member body part which has a pressing surface corresponding to the recess bottom surface, and the pressing members are detachably coupled to the rod body part such that the pressing surface adjoins to the recess bottom surface;

6

wherein the rod body part has fixing, protrusions on an inner surface;

wherein each of the pressing members has fixing levers each of which is coupled to either end of the pressing member body part;

wherein the pressing member body part has support protrusions each of which is provided on either end of each of the pressing surface;

wherein each of the support protrusions has a shaft-hole;

wherein each of the fixing levers has pivot shaft at one end and a fixing-hole in an are that is adjacent to another end; and

wherein each of die fixing disposed such that the pivot shat is fitted into the shaft-hole.

2. The permanent rod according to claim 1, wherein the pair of cut surfaces has a concave-convex shape that allows the cut surfaces to engage with each other when the cut surfaces are adjoined to each other.

3. The permanent rod according to claim 2, wherein each of the pressing recesses is formed so as to have a V-shaped recess bottom surface.

4. The permanent rod according to claim 2, wherein the rod body part comprises a ring-seating groove on an outer surface, the ring-seating groove extending in a longitudinal direction of the rod body part.

5. The permanent rod according to claim 2, wherein each of the pressing members has a tubular shape, and each of the pressing members has injection-holes in an area that adjoins to the recess bottom surface.

6. The permanent rod according to claim 1, wherein each of the pressing recesses is formed so as to have a V-shaped recess bottom surface.

7. The permanent rod according to claim 1, wherein the rod body part comprises a ring-seating groove on an outer surface, the ring-seating groove extending in a longitudinal direction of the rod body part.

8. The permanent rod according to claim 1, wherein each of the pressing members has a tubular shape, and each of the pressing members has injection-holes in an area that adjoins to the recess bottom surface.
